

# Remote Control Applications

These are applications that allow 1 device to connect to another device over the internet. They share keyboards and their mice and their screens or monitors.

The beauty of these applications is the capability working across different platforms.

The number one requirement to be able to do this is an internet connection.

This does not work on dialup.

The second requirement is trust. You are allowing someone to access your device over the internet.

The Third requirement is make sure you close down the application when you are finished to stop the connection.

The First Application is **Teamviewer**.

This application Launched in 2005 by a German company and has added more features over the years

It is free for personal use. There is a paid Commercial version

The program assigns 2 codes an **Identification Code** and a **Password**.

When the application is started it creates a different password every time. This is for your protection and security.

The 2 main features

Is the ability to view the other person's device and transfer files.

This Application is available on most platforms .

## The second Application **AnyDesk**

This application Launched in 2014 by a German company

It is available on these platforms

It is free for personal use. There is a paid premium version

When the application is installed on your device it assigns a number for that device and it does not change.

There is no password.

After you start the application you give the person you want the help from.

When a connection is asked for there is a window that pop up and you have to click on the green accept button at the bottom of the window.

This will let the other person have access to your device.
